(54) PREPARATION OF COMPOSITE PERMEABLE MEMBRANE FOR SEPARATING GAS

cludes, e.g. ethylenediamine and propylenediamine.

(57) Abstract:

COPYRIGHT: (C)1984,JPO&Japio

**PURPOSE:** To prepare a composite permeable membrane for repairing a gas, which has high gas permeability and undergoes rapid membrane forming reaction, by contacting a membrane substrate, obtained by coating a porous support membrane with siloxane diisocyanate, with vapor containing a polyamino compound.

**CONSTITUTION:** A membrane substrate obtained by coating a porous support membrane with siloxane diisocyanate, wherein at least 50mol% of the total polyisocyanate component is represented by formulae I and/or II, is contacted with vapor containing a polyamino compound having at least two primary and/or secondary amino groups to form an ultra-thin membrane on said support membrane. The polyamino compound is usually liquid or a low m.p. one and in-
